OE QUALITY YOU CAN TRUST

- An ultra-hard durable seat surface resistant to wear
- Reduced emissions and enhanced engine performance due to improved valve sealing

- 99% of the AE valves range is produced in Federal-Mogul's OE plant
- All AE valves are tested for roundness and concentricity
- Every single AE valve is laser marked with an AE part number for easy identification

КОМПОНЕНТЫ АЕ ДЛЯ ВЕРХНЕЙ ЧАСТИ ДВИГАТЕЛЯ

**КОНТРОЛЬ СЖИГАНИЯ ТОПЛИВА ДЛЯ
КОНТРОЛЯ ВЫБРОСОВ**

Ключевой элемент для всех способов снижения выбросов CO₂ - точное измерение объемов воздуха и топлива, подаваемых в камеру сгорания, а также продуктов сгорания, выходящих из камеры. Большая часть процесса контролируется устройствами, называемыми «компоненты верхней части двигателя», - они примыкают к головке блока цилиндров.

Турбонаддув и новые способы сжигания топлива с уменьшением выделения CO₂ связаны с повышением температуры и давления в камере сгорания, а биологические компоненты топлива создают еще более агрессивную среду. Новейшие материалы и технологии крайне важны для обеспечения долговечности деталей по приемлемой цене. Так конструкторы двигателей могут внедрять дальнейшие инновации для сокращения расхода топлива и вредных выбросов.

Клапаны подвергаются самому сильному воздействию при работе двигателя. При высоких температурах и других неблагоприятных условиях они должны не просто работать, а обеспечивать надежное уплотнение.

Линейка клапанов AE Federal-Mogul является самой широкой на мировом вторичном рынке и предназначена для применения в более чем 35 000 различных системах.

Каждая деталь точно соответствует назначению, а материал подбирается так, чтобы седло клапана и направляющая функционировали как единая слаженная система.

Выбор материалов настолько важен, что некоторые клапаны AE (так называемые «биметаллические») изготавливаются из двух различных материалов: очень прочного и термостойкого для головки клапана и чрезвычайно износостойкого для стержня клапана. Менее дорогостоящее решение для менее агрессивных сред - термообработка конца стержня клапана для стойкости к ударным нагрузкам и вращению. Кроме обычных могут

AE® - специалист по деталям верхней части двигателя
В ассортимент AE® входят более 35 000 наименований

использоваться материалы с различными свойствами. Защитный слой из ультратвердого сплава Stellite 12 (хром, никель, вольфрам и кобальт) можно нанести на наиболее уязвимые области (включая вставное седло клапана), а хромированное покрытие - на стержень клапана, чтобы защитить его от коррозии и улучшить его скольжение в направляющей втулке.

Сопряжение с направляющей клапана крайне важно, так как клапан должен свободно подниматься и опускаться с минимальным трением, но в то же время образующийся зазор между стержнем клапана и его направляющей должен эффективно противостоять очень высокому давлению в камере сгорания, чтобы не происходило утечек. Направляющая клапана также передает к системе охлаждения около 25% общего тепла, отведенного выпускным клапаном от камеры сгорания.

На сегодня ассортимент AE является одним из самых широких и включает более 1200 клапанов, 280 распределительных валов и сопряженных деталей, 400 направляющих клапана, 60 гнезд клапана, пружины клапана и сухари клапана для более чем 4400 различных двигателей и более 18 400 систем. Ассортимент дополняется ремнями привода газораспределительного механизма для более чем 14 000 систем, так как если необходимо заменить клапан, всегда требуется проверять состояние распределительного вала и приводные ремни. Каждая деталь не только изготовлена в соответствии со стандартами оригинального качества, но и разработана с глубоким пониманием функционирования и взаимодействия различных материалов. Поэтому долговечность и долговременная эффективность гарантируются.

VALVES TROUBLE TRACER CHART

RADIAL CRACKING OF VALVE HEAD, LEADING TO A TRIANGULAR SEGMENT BREAKING OFF

Symptom: Sudden mechanical noise. Rough running. Possible seizure.
Cause: Poor temperature distribution across the valve head resulting in high tensile stresses in the rim, often combined with severe

deflection of the head due to abnormal combustion pressures and temperatures. Extreme thermal cycles, (continual sudden changing from full power to shut-down). Damage marks on the rim producing stress raisers. Mechanical overload from valve bounce.

Remedy: Check the remaining valves for signs of cracking, replace where necessary. Ensure the correct valves have been used. Check engine settings, valve springs, guides and followers. Do not overspeed the engine.

“GUTTER” BURNT THROUGH VALVE RIM

Symptom: Loss of power. Rough running.
Cause: Valve clearance too small holding the valve off its seat. Sticking stem, poor/uneven seating or misalignment of the valve assembly. Overheating from pre-ignition. Excessive build up of carbon which flakes off the valve face to form a gas leakage path. Hard carbon particles peen into the seat surface until enough indentations line up to form a gas leakage path.
Remedy: Ensure valve clearance is to specification. Check stem to guide clearance and for any misalignment of the valve assembly. Check engine timing, carburettor settings and injection timing.

EXCESSIVE VALVE STEM AND GUIDE WEAR

Symptom: Valve gear noise, high oil consumption, exhaust smoke on initial start up.

Cause: Too great or too small valve stem to guide clearance. Poor valve stem lubrication or ingress of dirt through the air intake system. It should be noted that the cause of this

problem is not always obvious. Unless the cause is readily apparent, additional advice should be sought.

Remedy: Ensure correct valve and guides are fitted. Check alignment, valve stem to guide clearances, valve stem seals and lubrication system.

VALVE HEAD BREAKING OFF STEM

Symptom: Rough engine with sudden mechanical noise.
Cause: Mechanical overload, such as seating velocity too high from excessive valve clearances (see graph of cam lift). Valve bounce, valve to piston contact caused by overspeeding, weak or broken valve springs or sticking valve stem. Uneven seating due to misalignment or distorted valve.
Remedy: May not be possible due to extreme damage this failure can cause, however: Check valve springs, guides and alignment and repair where necessary. Check seat guides, pistons and bores for damage. Reset the valve clearances.

INLET VALVE UNDERHEAD CARBON BUILD-UP

Symptom: Poor starting. Loss of power. Blue smoke from exhaust (when throttle closed).
Cause: Excessive clearance between valve stem and guide. Valve stem seal failure or wear. Excessive oil supply due to blocked drainage paths. Incorrect grade of lubricating oil used.
Remedy: Check valve stems, guides and stem seals for wear and replace where necessary. Ensure there is no blockage in the engine drainage or breathing systems.

STEM BREAKAGE THROUGH COLLET GROOVE

Symptom: Excessive mechanical noise, bent stem and possible head detachment.

Cause: Poor assembly allowing uneven loading. Poor handling, dropping etc. Bouncing the valve after fitting by hitting the tip with a hammer. Valve bounce from excessive seating velocity.

Remedy: May not be possible

due to extreme damage this failure can cause, however: Check seats, guides, springs, pistons and bores for damage and repair where necessary. Do not overspeed the engine.

BLOW HOLE THROUGH VALVE HEAD, STARTING FROM A RADIAL CRACK

Symptom: Rough running. Loss of compression. Poor starting.

Cause: Similar to a segmental breakage, but gas escapes through the crack and burns a hole. Extreme

thermal cycles (continual sudden changing from full power to shut down). Damage marks on the rim producing stress raisers. Mechanical overload from valve bounce.

Remedy: Check remaining valves for signs of cracking, replace where necessary. Ensure the correct valves have been used. Check engine settings, valve springs, guides and followers. Do not overspeed engine.

SCUFFED/STICKING VALVE STEM

Symptom: Poor performance due to low compression. Mechanical breakage due to sticking valves.

Cause: Marginal lubrication from inadequate valve to stem clearance, causing scuffing or metal transfer. This may ream out the valve guide leading to the second cause, excessive oil from too great a clearance carbonising on the stem to cause sticking.

Remedy: Ensure the valve stem to guide clearance is to specification. Ensure the correct valve stem seals have been used. Replace worn components where necessary.

VALVE OPERATING CONDITIONS

- Initial valve opening and final valve closing occurs very gently. Cam lobe profiles include lifting and lowering ramps to achieve this.
- Ensure the valve clearances are not too great to prevent the valve being hammered open or dropped onto its seat. (See diagram)

- The valve seat must be concentric with the valve guide. Any eccentricity that exists between the valve seat and guide will force the valve sideways.
- Excessive valve guide wear will occur as a result of this which can lead to a fatigue failure of the valve stem.

Typical exhaust valve temperature distribution in a spark ignition engine. Figures are degrees in centigrade.

- An exhaust valve may operate at up to 800 °C, and 75% of its cooling is by transferring heat to the valve seat.
- Ensure the valve seat contact is correct and as specified by the engine manufacturer.

VALVE BREAKAGES – FRACTURE AT LOWER COTTER GROOVE

Symptom: Valve breakage shortly after cylinder head rebuild, during initial start-up or during test run.

Cause: Over extension / “pump-up” of hydraulic lifters (photo 1). Incorrect seating of the valve spring to the cylinder head (photo 2).

Engine over-speed or weak valve springs.

Remedy: Whenever possible fit new hydraulic lifters, when new valves are fitted. Ensure the engine block has been thoroughly cleaned to remove all traces of debris. Take extreme care to seat all valve springs correctly in the recess of the cylinder head. Renew engine oil and replace oil and air filters.

Federal-Mogul ADVANCED ANTI-COUNTERFEIT PROGRAMME

The following features on all engine packaging prove that the parts inside are Original Quality.

CHECK THE UNIQUE CODE ONLINE AT www.fmecat.eu

Each Federal-Mogul part has a unique code which is displayed on the labels in an alphanumeric and Data Matrix format.

A Data Matrix code is a 2-dimensional (2-D) matrix barcode.

The Unique Code can be verified in 3 different ways:

- Typing in the Unique Code
- Reading the 2-D code with a 2-D scanner
- Reading the 2-D code with a mobile phone which is supported by NeoReader™ (www.neoreader.com)

For further details please check www.fmecat.eu

LOOK FOR THE HOLOSPOT®

The Holospot® label features a 4-digit alphanumeric code.

Please check it to make sure that:

- The 4-digit code appears in rainbow colours using the light of the magnifier and is different on each pack
- The Federal-Mogul logo also appears in the Holospot®. The last 4 digits of the alphanumeric code have to be the same as the ones in the Holospot®

PROTECTION

Special label design means any attempt to remove or swap the label will result in tearing

PERMANENT SELF-ADHESIVE LABEL

Seals the box with label detail on the front

CRASH LOCK BOX BOTTOM

Prevents any attempt to remove or exchange items as it is impossible to reseal once opened

Verify the Unique Code online at www.fmecat.eu
